Cover picture: Triple immunofluorescence image taken with a Bio-Rad MRC-1000 confocal microscope demonstrating the discrete distribution of sodium channels (*green*) on pyramidal neurons (*red*) in the electrosensory lateral line lobe of the weakly electric fish *Apteronotus leptorhynchus*. GFAP-positive glia are also labeled (*blue*). Clusters of sodium channels are localized to the membrane surface of the Neurobiotin-labeled pyramidal cell bodies and to their apical dendrites that project toward and overlay the molecular layer. This distribution is shown to underlie an oscillatory discharge that may establish frequency selectivity *in vivo*. See related article by Turner et al., pp. 6453–6471.
