Cover picture: Seven pseudocolor images of the upper surface of an embryonic chicken ciliary ganglion neuron subjected to triple-labeling and imaging by laser scanning confocal microscopy. *Red* marks synaptic sites (mAb 10h, recognizing SV2), *blue* marks α -Bgt-AChRs (α -Bgt, recognizing principally an $\alpha 7$ subunit-containing AChR), and *green* marks mAb 35-AChRs (mAb 210, recognizing principally an $\alpha 3\alpha 5\beta 4$ subunit-containing AChR). Around the periphery of the hexagonal array of images are three two-color images interspersed with the three single-color images used to generate them. At the center is the three-color image, which shows that most of the α -Bgt-AChRs and the mAb 35-AChRs are located in common regions that lie immediately adjacent to synaptic sites. See Wilson Horch and Sargent, pp. 7778–7795.
