July 18, 2007 • Volume 27 Number 29 www.jneurosci.org

**Cover legend:** Histone deacetylase inhibitors modulate the fate choices of neonatal rat precursor cells. The images show primary cultures of subventricular zone cells stained with DAPI (blue), the “astrocytic” marker GFAP (red), and the “neuronal” marker TuJ1 (green) after treatment with histone deacetylase inhibitors. For details, see the article by Liu et al. in the July 4, 2007 issue (pages 7339–7343).

Clifford, which appeared on pages 7136–7140 of the July 4, 2007 issue, the shading of each pair of bars in Figure 3 was mistakenly reversed. In the correct figure, the right bar of each pair is gray (corresponding to the Visible hand condition), and the left bar is black (the No view condition). The correct Figure 3 is printed in this issue.

**Correction:** In the July 4, 2007 issue's "This Week in The Journal" summary of the Behavioral/Systems/Cognitive article by Khan et al., the first sentence should have read "Neuroendocrine neurons in the paraventricular hypothalamic nucleus (PVH) respond to hypoglycemia with synthesis and release of corticotropin-releasing hormone (CRH)."
