Cover legend: The axons of an ON cone bipolar cell type (red with long, descending axons) contain synaptic ribbons (green) high in their axons, which make contact with dopaminergic amacrine cells (cyan) of the rabbit retina. These axonal synapses explain the ON light responses of three retinal cell types, which ramify in the OFF layer and challenge the traditional ON/OFF segregation of bipolar cell outputs. For more information, see the article by Hoshi et al. in this issue (pages 8875–8883).

Correction: In the article "Inhibition of Autophagy Induction Delays Neuronal Cell Loss Caused by Dysfunctional ESCRT-III in Frontotemporal Dementia" by Jin-A Lee and Fen-Biao Gao, which appeared on pages 8506–8511 of the July 1, 2009 issue, there is an error on page 8509. The authors stated that "Electron microscopy revealed a number of autophagosomes in neurons from E7.5 *mSnf7-2* knock-out embryos, suggesting that depletion of ESCRT *in vivo* also causes defects in the autophagy pathway (Fig. 3F)." The correct statement that matches with the figure legend is as follows: "Electron microscopy revealed a number of autophagosomes in cells of E6.5 *mSnf7-2* knock-out embryos, suggesting that depletion of ESCRT *in vivo* also causes defects in the autophagy pathway (Fig. 3F)."
