Cover Legend: Scanning electron microscope image shows the ciliated endings of olfactory sensory neurons, which cover the turbinates of the nasal passage and are directly exposed to the external environment. Proper protein trafficking into these distinct subcellular compartments is essential since cilia serve as the site for odorant detection. For more information, see the article by Jenkins et al. in this issue (pages 10541–10551).

Correction: In the article “Parallel Use of Two Behavioral Mechanisms for Chemotaxis in Caenorhabditis elegans” by Yuichi Iino and Kazushi Yoshida, which appeared on pages 5370–5380 of the April 29, 2009 issue, there was an error in the presentation of the unit for NaCl gradient. In Fig. 2C, D, E, Fig. 4C, D, E, F, Fig. 6, and supplemental Figs. 2 E and 4, the unit for NaCl gradient was erroneously depicted as mM/mm, but it is in fact mM/cm. Also in Materials and Methods, there were two errors. In the right column of page 5371, the 29th line from the bottom should read “in millimolars per centimeter” instead of “in millimolars per millimeter,” and the last line of the same column should read $\sqrt{2}/\pi$ cm instead of $\sqrt{2}/\pi$ mm. These were problems of presentation and all other results including the computer simulation in Fig. 3, which were based on the relationship in Fig. 2C, remain unaffected.
