September 23, 2009 • Volume 29 Number 38 • www.jneurosci.org

**Cover legend:** Transverse section through the neonatal spinal cord of a double-transgenic mouse engineered so that ubiquitous expression of a  $\beta$ -galactosidase/neo fusion protein is replaced by that of GFP specifically in cells that express glial fibrillary acidic protein. Section is labeled with antibodies against GFP (green), the neuronal marker NeuN (red), and  $\beta$ -galactosidase (blue). For more information, see the article by Garrett and Weiner in this issue (pages 11723–11731).

**Correction:** In the “Table of Contents” of the September 9, 2009 issue, there was an error in the cover legend. The first three sentences should read: “Reconstruction of human cortical surface in the FreeSurfer software. The reconstruction is based on magnetic resonance imaging anatomical images. The red/green overlay shows the pattern of cortical folding (red, sulci; green, gyri).” Also, in the right column of “This Week in The Journal,” which appeared on page i of the same issue, there was an error in the sentence that begins on the 13th line. That sentence should read: “They predicted that representations of the vertical meridian, which forms the border between highly interconnected mirror-image representations of a visual hemi-field, should occur on gyri, whereas representations of the horizontal meridian should occur in sulci.”
