Cover legend: Dorsal and lateral views of confocal z-stacks of the brain and spinal cord of a 5-d-old zebrafish expressing membrane-targeted GFP driven by the *otpb.A* enhancer line, delineating ascending and descending projections from diencephalic *otpb* neurons. The dorsal and lateral stacks were pseudocolored in ImageJ and are 60 μm and 40 μm thick, respectively. The *otpb* descending projections into the spinal cord comprise the dopaminergic diencephalospinal tract, which mediates the developmental switch from an immature to a mature locomotor pattern in zebrafish larvae. For more information, see the article by Lambert et al. (pages 13488–13500).
