Cover legend: The colored trajectories of this image depict the movement of individual GFP-tagged transmembrane proteins on the plasma membrane of a cultured rat hippocampal neuron (each filled circle indicates the first position of a trajectory). Together they delineate the morphology of a dendritic spine. Note that the trajectories appear more clustered, and their displacements appear shorter at the tip of the spine, the most common site of postsynaptic membrane. For more information, see the article by Li et al. (pages 4276–4295).
