

Cover legend: The image shows the close association between the processes of retinal microglia and presynaptic and postsynaptic structures in the retina. GFP-expressing microglia (green) located in the outer plexiform layer of the retina of a 2-month-old adult *CX3CR1^{GFP/+}* transgenic mouse are in close physical contact with presynaptic axon endings from cone photoreceptors labelled with cone arrestin (red) and postsynaptic rod bipolar dendrites labelled with PKC α (blue). For more information, see the article by Wang and Zhao (pages 2827–2842).
