Cover legend: This image shows the dendritic trees of two Purkinje cells from wild-type (left, orange) and mutant mice lacking the alpha- and gamma-Protocadherin gene clusters (*Pcdhs*) (right, blue). Purkinje cells were labelled with fluorophores, and shown as confocal projections with surface rendering and color to illustrate depth. *Pcdhs* promote dendrite self-avoidance to ensure that Purkinje dendrites are evenly arranged across the arbor, with minimal overlaps between branches. For more information, see the article by Ing-Esteves et al. (pages 2713–2729). Image by Julie Marocha.
