Cover picture: Photograph, reproduced from a color lantern slide, of a cat beta-type retinal ganglion cell at postnatal day 31 that has been injected intracellularly in a living retinal whole-mount preparation maintained in vitro and filled with the dye Lucifer yellow to reveal its dendritic and axonal morphology. The same cell is also retrogradely labeled with rhodamine microspheres (obscured by the Lucifer yellow dye), as are many neighboring ganglion cells. Illustration provided by the authors, A. S. Ramoa, G. Campbell, and C. J. Shatz, from their paper (pp. 4239-4261, this issue).
