Supplemental Figure S5. Pressure application of AMPA activates AMPA receptors in the recorded basket cell (supplement to the data shown in Fig. 5C).

A, Characteristic whole-cell recordings shown at high gain (average of three traces); fragments of the depolarizing command voltage step and evoked action current can be seen. A pressure pulse of AMPA (gray segment) exerts an inward current (onset is denoted by arrow) indicating that AMPA reached and activated AMPA receptors in the recorded cell.

B, Line scan recordings from an individual axonal bouton in the same basket cell (see Fig. 5C for details and notations).
