Supplementary Figure 1. Effects of anesthesia on spontaneous discharge rates.

For units at P8, P10 and P11-P28 the spontaneous rates did not vary strongly with the depth of anesthesia as seen from the distribution of the rates which stay similar at different times after the last dose of anesthesia (linear regression: P8: r=0.18, p=0.4, n=21 (solid line); P10: r=-0.3, p=0.08, n=33 (dashed line); P11-P28: r=0.005, p=0.9, n=216). Data of both strains were pooled as no differences were estimated.
