Table 1: **Summary of letter-specific gamma-band patterns.** Each row of the table describes the electrodes for one patient in our dataset. The second table column indicates the location where the patient was tested (BW, Brigham & Women's Hospital [Boston, USA]; CH, Children's Hospital [Boston, USA]; Fr, University Clinic in Freiburg [Germany]; UP, Hospital at the University of Pennsylvania [Philadelphia, USA]). Columns three through seven indicate the counts of electrodes observed in different left-hemisphere brain regions. In each cell of the table, the first number indicates the number of electrodes exhibiting either high- or low-gamma letter-sensitive activity, and the second number indicates the total number of electrodes observed in that brain region. Columns eight through twelve indicate similar information for the right hemisphere. Column thirteen indicates the total numbers of electrodes observed in each patient.
