Cover picture: Photograph of a flat mounted rhesus monkey retina immunoreacted with a monoclonal antibody, CSA-1, specific for red- and green-sensitive cone photoreceptors. The label-free large profiles are blue-sensitive cones, and the small unstained profiles are rods. Additional antibodies to both blue- and red/green-sensitive photoreceptors were used to study cone distributions in retinae of diurnal and nocturnal primates in the paper by K.C. Wikler and P. Rakic in this issue (pp. 3390–3401).
