**Cover picture:** Triple immunofluorescent labeling in one-day-old chick cerebellum showing the distribution of the protein tyrosine kinase Cdk5 (green) in the molecular layer, the ryanodine receptor in Purkinje cells (red), and astrocytes positive for glial fibrillary acidic protein (blue). In the cerebellum, Cdk5 immunoreactivity does not coincide with Purkinje cell dendrites nor with Bergman glia, but is instead confined to the nonsynaptic portions of granule cell axons in the molecular layer and to the cell bodies of pre-migratory granule cells in the external germinal cell layer. See Pasquale et al., pp. 3956–3967.

**Erratum:** Due to a publisher's error, the article entitled "Estradiol Mediates Fluctuation in Hippocampal Synapse Density during the Estrous Cycle in the Adult Rat" (C.S. Woolley and B.S. McEwen; *J Neurosci* 12:2549–2554, July 1992) was printed with an incorrect formula for a "conventional" method for calculation of synapse density. The formula should read as follows:

$$\text{est } N_v = N / (\text{corr } A \times d)$$
