Cover picture: Nestin expression reveals heterogeneity among astrocytes cultured from rat cerebral cortex. *Green* fluorescence corresponds to immunoreactivity with an anti-GFAP antibody; *red*, to an anti-nestin antibody. Cells that coexpress both intermediate filament proteins appear *yellow/orange*. See Gallo and Armstrong, pp. 394–406.

Erratum: In “A Rhodopsin Gene Mutation Responsible for Autosomal Dominant Retinitis Pigmentosa Results in a Protein That Is Defective in Localization to the Photoreceptor Outer Segment” (C.-H. Sung, C. Makino, D. Baylor, and J. Nathans), which appeared on pages 5818–5833 in the October 1994 issue, the legend for Figure 6B on page 5825 should read: “*Continuous lines* show fits with exponential saturation functions $[r/r_{\max} = 1 - \exp(-ki)$ where k is a constant that is proportional to the sensitivity of the cell. . . .”
