i Instructions for Authors

Cover picture: Clonally related cells migrating radially out of the ventricular zone of the embryonic chick spinal cord, then turning orthogonally and migrating tangentially. The progenitor of these cells was infected with a recombinant retrovirus injected into the lumen of the neural tube; that cell's progeny were subsequently detected with a histochemical reaction that turned their nuclei blue. The tangentially migrating cells are neurons and follow an axonal pathway. For details, see the article by Leber and Sanes in this issue (pp. 1236–1248).
