

Erratum

In the article "Stages of Synapse Development Defined by Dependence on F-Actin," by Wandong Zhang and Deanna L. Benson, which appeared on pages 5169–5181 of the July 15, 2001

issue, Figure 9 was incorrectly printed without the correct gray shading. The correct version of the figure, as well as the legend, is printed here.

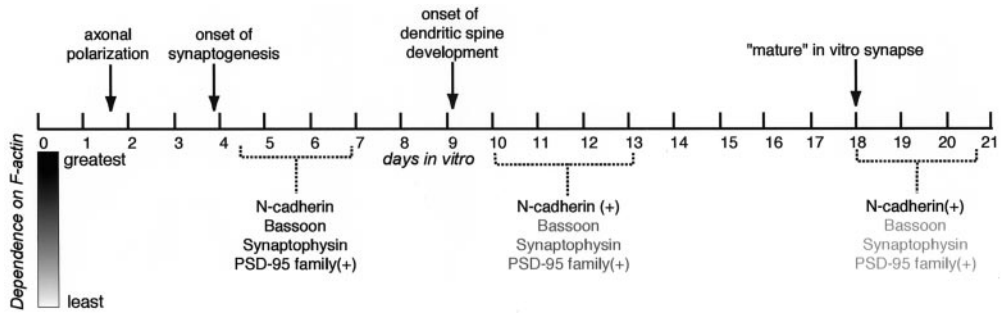

Figure 9. Juxtaposed against a time line summarizing major developmental events in cultured hippocampal neurons are synaptic proteins that are written with *black*, *medium gray*, or *light gray* to depict their dependence on F-actin for their synaptic localization (*black* = most dependent). Molecules restricted to excitatory synapses are indicated by (+).
