December 3, 2003 • Volume 23 Number 34 www.jneurosci.org

**Cover picture:** Isolated postsynaptic densities (PSDs) visualized by rotary-shadow electron microscopy. Viewed from its cleft surface (top), the PSD is studded with a flat layer of granular particles that coat a central filamentous mesh. PSDs were labeled with immunogold for CaMKII, which is restricted to the cytoplasmic surface of the PSD (bottom) but not the cleft surface (10 nm immunogold particles colored red). The cytoplasmic surface of the PSD is highly convoluted with protrusions of material extending from its central mesh, and most of the label for CaMKII is found on these protrusions. For details, see the article by Petersen et al. in this issue (pages 11270–11278).

**Correction:** In the article “Lesions of Mature Barrel Field Cortex Interfere with Sensory Processing and Plasticity in Connected Areas of the Contralateral Hemisphere,” by V. Rema and Ford F. Ebner, which appeared on pages 10378–10387 of the November 12, 2003 issue, the text citation for Figure 8 at the end of the last paragraph on page 10383 is incorrect. Figure 7 should be cited in that instance.
