

# The Journal of Neuroscience

April 30, 2008 • Volume 28 Number 18 www.jneurosci.org

**Cover legend:** In the hippocampus of 8-week-old wild-type mice, almost all astrocytes express the transcription factor Pax6. Anti-GFAP antibody (magenta) marks astrocytes; GFAP-positive astrocytes express Pax6 protein in their nuclei (green). The picture was taken by a confocal laser microscope. For more information, see the article by Sakurai et. al. in this issue (pages 4604–4612).

**Correction:** In the April 9, 2008 issue's "This Week in the Journal" summary of the Development/Plasticity/Repair article by Coate et al., there was an error in the third sentence. The term "DP cells" should have been "EP cells." Thus, the sentence should have read "This week, Coate et al. report that interactions between a type A ephrin (MsEphrin), which is expressed in some *Manduca* neurons [enteric plexus (EP) cells], and the MsEph receptor, which is expressed in midline cells, are required to prevent improper midline crossing by EP cells and axons."
