**Cover legend:** Topographic organization of thalamocortical connectivity in mice. Back-labeled cells in the dorsal lateral geniculate nucleus (red) and in the ventrobasal nucleus (green) of the thalamus were observed after a single Dil crystal was placed into the primary visual cortex and DiA into the primary somatosensory cortex of a postnatal day 10 mouse. This pattern persists in mice in which Pax6 has been knocked out. For more information, see the article by Piñon et al. in this issue (pages 8724–8734).

**Correction:** In the article “Quantitative Analysis of Calcium-Dependent Vesicle Recruitment and Its Functional Role at the Calyx of Held Synapse” by Nobutake Hosoi, Takeshi Sakaba, and Erwin Neher, which appeared on pages 14286–14298 of the December 26, 2007 issue, Equations 3 and 7 are not printed correctly because of a printer’s error. In Equations 3 and 7, the variable  $[Ca^{2+}]_i$  should have been raised to the exponent  $n$ . Moreover, in Equation 7, a closing parenthesis should have been included after the variable  $[Ca^{2+}]_i^n$ . The correct equations are as follows:

$$k_i = k_{1,b} + k[Ca^{2+}]_i^n, \quad (3)$$

$$\frac{dn_B}{dt} = -(\tau_b^{-1} + k[Ca^{2+}]_i^n)(n_B - n_{B,0}). \quad (7)$$
