May 20, 2009 • Volume 29 Number 20 • www.jneurosci.org

**Cover legend:** Microtubules, as visualized with an  $\alpha$ -tubulin antibody, form excessive loops in the axons of neurons derived from a zebrafish *phr* mutant. These defects lead to guidance failures at intermediate targets *in vivo*. For more information, see the article by Hendricks et al. in this issue (pages 6593–6598).
