July 1, 2009 • Volume 29 Number 26 • www.jneurosci.org

**Cover legend:** Selective inactivation of transcription factor Pax6 in the cortex at the onset of neurogenesis causes a region-specific increase and ectopic localization of layer 5 (labeled with *Ctip2*; red) and layer 6 (labeled with *Tbr1*; green) neurons and an almost complete absence of upper cortical layers. Massive progenitor accumulation at the corticostriatal border also occurs in the mutant brain. For more information, see the article by Tuoc et al. in this issue (pages 8335–8349).

**Correction:** For the article “Maturation of Ribbon Synapses in Hair Cells Is Driven by Thyroid Hormone” by Gaston Sendin, Anna V. Bulankina, Dietmar Riedel, and Tobias Moser, which appeared on pages 3163–3173 of the March 21, 2007 issue, there are three corrections. (1) In Materials and Methods, Real-time RT-PCR, TaqMan Gene Expression Assays Mm01330351\_mH, Mm00464451\_m1 and Mm01336180\_m1 were used to amplify cDNAs for SNAP23, Bassoon, and SNAP25 (instead of for Bassoon, SNAP25, and SNAP23, as erroneously stated in the original text). (2) In Figure 3A, the first SNAP25 label should read SNAP23; currently and erroneously there are two labels reading SNAP25.
