June 16, 2010 • Volume 30 Number 24 • www.jneurosci.org

Cover legend: Inverted two-tone image of a human face (Mooney face) used to examine the role of high-frequency gamma-band activity during perceptual closure, the coherent perception of an incomplete image. Although Mooney faces are easily identified as faces when presented in the upright orientation, they are difficult to recognize when inverted. For more information, see the article by Grützner et al. in this issue (pages 8342–8352).

Correction: In the article “Synaptic and Vesicular Coexistence of VGLUT and VGAT in Selected Excitatory and Inhibitory Synapses” by Johannes-Friedrich Zander, Agnieszka Münster-Wandowski, Irene Brunk, Ingrid Pahner, Gisela Gómez-Lira, Uwe Heinemann, Rafael Gutiérrez, Gregor Laube, and Gudrun Ahnert-Hilger, which appeared on pages 7634–7645 of the June 2, 2010 issue, the authors regret that they did not cite the work of Fattorini et al. (2009) [Fattorini G, Verderio C, Melone M, Giovedi S, Benfenati F, Matteoli M, Conti F (2009) VGLUT1 and VGAT are sorted to the same population of synaptic vesicles in subsets of cortical axon terminals. *J Neurochem* 110:1538–1546], which is directly relevant to some of the results described in this report.

Correction: In the article “Progressive and Lasting Amplification of Accumbal Nicotine-Seeking Neural Signals” by Karine Guillem and Laura L. Peoples, which appeared on pages 276–286 of the January 6, 2010 issue, one of the grants listed was incorrect: funding was provided by National Institute on Drug Abuse Grant P50 CA/DA84718, not by National Cancer Institute Grant 4100020574. The authors regret this error.
