**Cover legend:** Financial decision making can be especially risky for older investors, who have relatively little time left to recover from mistakes. A new study reveals that age-related mistakes in financial risk taking are mediated by a novel measure of neural signal variability in the striatum. For more information, see the article by Samanez-Larkin et al. in this issue (pages 1426–1434). Illustration © Janusz Kapusta / Corbis

1575 **Erratum:** In the article “The Spatial Patterning of Mouse Cone Opsin Expression Is Regulated by Bone Morphogenetic Protein Signaling through Downstream Effector COUP-TF Nuclear Receptors” by Shinya Satoh, Ke Tang, Atsumi Iida, Mariko Inoue, Tatsuhiko Kodama, Sophia Y. Tsai, Ming-Jer Tsai, Yasuhide Furuta, and Sumiko Watanabe, which appeared on pages 12401–12411 of the October 7, 2009 issue, there were erroneous duplications of images in Figures 1 and 5. In Figure 1, S-opsin day 7 (left column #3) and M-opsin day 14 (right column #4) are the same picture, flipped vertically. Additionally, the image in M-opsin day 14 is not correct. In Figure 5B, the same images were used for the control for COUPI KO and the control for COUPII CKO. Additionally, the images in COUPII CKO are not correct. The corrected Figures 1 and 5 are shown in this issue. The original figure legends are correct.
