Cover legend: Neural stem cells isolated from the subventricular zone of an adult C57BL/6 mouse. These cells form neurospheres in culture, and upon plating onto a matrix, they differentiate. The image shows neurosphere cells expressing β -III tubulin (red) and glial fibrillary acidic protein (green). Their nuclei are stained with 4',6-diamidino-2-phenylindole (DAPI). For more information, see the article by Gadadhar et al. in this issue (pages 2615–2623).

Correction: In the article “A p38 Mitogen-Activated Protein Kinase-Dependent Mechanism of Disinhibition in Spinal Synaptic Transmission Induced by Tumor Necrosis Factor- α ” by Haijun Zhang, Hui Nei, and Patrick M. Dougherty, which appeared on pages 12844–12855 of the September 22, 2010 issue, the authors regret that one of the authors’ names was misspelled. “Hui Nei” should have read “Hui Nie.”
