Cover legend: This image shows the ventrolateral white matter of an injured mouse spinal cord, just rostral to the lesion site (7 d after injury). Spinal cord sections were immunolabeled for glial fibrillary acidic protein to visualize astrocytes (magenta). Reactive microglia/macrophages (green) were stained for ionized calcium-binding adaptor protein-1 and are interspersed among astrocytic processes. Hoechst dye was used to label cell nuclei (cyan). Art and original image by Faith H. Brennan and Luke A. Hammond. For more information, see the article by Brennan et al. (pages 6517–6531).
