**Cover legend:** This image is a z-projection of a two-photon confocal image stack of a starburst amacrine cell (magenta) and a direction-selective ganglion cell (green) filled with Alexa dyes via a patch pipette in a mouse retina. Areas of dendritic overlap between the two cells (white) are potential sites of GABAergic inhibitory synapses from the starburst amacrine to the direction-selective ganglion cell. These synapses emerge during the second postnatal week of development in the mouse retina. For more information, see the article by Morrie and Feller (pages 9281–9286).
