Cover legend: This picture illustrates the analysis of long-term potentiation (LTP) on thousands of isolated synapses by FASS-LTP (Fluorescence Analysis of Single-Synapse LTP). FASS-LTP is a novel method that tracks the insertion of glutamate receptors (green) directly at synapses, which are aligned and analyzed by flow cytometry. Notably, FASS-LTP data on cryopreserved human brains support the idea that synapses in Alzheimer disease patients are intrinsically defective in LTP.
