

Cover legend: Mammals defend their internal temperature against environmental cold by activating various effector mechanisms, including tail vasoconstriction and brown adipose tissue thermogenesis. This image shows thermal images of a wild-type mouse (top mouse in each panel) and a mouse lacking TRPM8 channels (bottom in each panel). TRPM8-deficient mice show defects in their thermoregulatory behavior, including a higher rate of heat loss through their tail (a major thermoregulatory organ in rodents) compared to wild-type animals. For more information, see the article by Reimúndez et al. (pages 3643–3656).
