Cover picture: Darkfield photomicrograph illustrating process outgrowth from clusters of human pheochromocytoma cells maintained in primary culture for 21 days. Process outgrowth and ectopic neuropeptide production in human pheochromocytoma cell cultures are increased by nerve growth factor and diminished by 10^5 M mexamethasone.

This photomicrograph was kindly provided by Dr. A. S. Tischler, and is from a paper by Drs. A. S. Tischler, Y. C. Lee, R. L. Perlman, D. Costopoulos, V. W. Slayton, and S. R. Bloom that is to appear shortly in the *Journal of Neuroscience*.

Instructions to Authors appear in the January issue only. Copies of the Instructions can be obtained by writing the Society for Neuroscience, 11 Dupont Circle, N.W., Washington, DC 20036, Suite 130.
