Cover legend: This image shows dorsal oligodendrocyte progenitor cells in the spinal cord of a larval zebrafish in which *gria4a*, the gene encoding the AMPA receptor subunit GluR4, was mutated. The larva had been treated with a glutamate receptor antagonist for 28 hours. The image is pseudo-colored based on fluorescence intensity of the mEGFP, which labels the membrane of myelinating oligodendrocyte progenitors. For more information, see the article by Piller et al. (pages 5353–5371)
