Cover legend: Confocal image of neural progenitors and their glial cell progeny in the developing mouse dorsal forebrain. Neural progenitors were co-electroporated in utero with transcription factor ASCL1-expressing constructs that over-activate the Notch signaling pathway (cyan). Notch pathway over-activation promotes the genesis of glial precursor cells, which express OLIG2 (magenta) and PDGFR α (yellow) as they mature. For more information on the molecular controls of the neuron-glia switch, see the article by Tran et al. (pages 6854–6871).
