

Supplemental Figure 1: Legend

Following stimulation with PDGF for 0-1440 min, OPCs were lysed, immunoprecipitated with an anti-WAVE2 antibody, and immunoblotted with an anti-phosphorylated Cdk substrate antibody. The cell lysates were also immunoblotted with an anti-WAVE2 (C-14) or β -actin antibody. Quantification of bands corresponding to the WAVE2 phosphorylation is shown below the upper panel.
