

**Supplementary Figure 1:** *The relationship between eccentricity maps and cortical folding.* Details of this figure are similar to those in **Figure 2**. In the scatter plots, the overall distribution is biased towards negative curvatures. In part, this may be due to the fact that FreeSurfer computes its ‘curv’ measure on a surface that represents the gray-white boundary, which has high negative curvature along gyral crowns, and lower positive curvature along the depths of sulci.
